NET731 Week 4 Report

Student name: Phenyo Tshifhenye

Student number: 20231149

Module: NET731

Week: Week 4 – Identity Management

Table of Contents

- 1. Introduction
- 2. Access Limited
- 3. What I Would Have Done if Access Was Available
- 3.1 Create Users in Microsoft Entra ID
- 3.2 Create a Security Group
- 3.3 Add Members to the Group
- 3.4 Assign Initial Basic Role
- 4. Evidence
- 5. Conclusion
- 6. References

1. Introduction

The purpose of Week 4 was to complete the identity management section of the NET731 practical. The task required the creation of users and groups in Microsoft Entra ID, followed by the assignment of initial basic access. These tasks are important because they demonstrate how user identities and permissions are controlled in an Azure environment.

According to the practical brief, Week 4 required the student to create users and groups in Microsoft Entra ID and assign initial roles with basic access.

2. Access Limited

When I attempted to access Microsoft Entra ID to perform the Week 4 task, the Azure portal displayed an access error. The page stated that I did not have access and the error details showed a 401 error code with the message “Insufficient privileges to complete the operation.” This indicates that the student account in the CTU-managed tenant does not have enough permissions to create or manage users and groups in Microsoft Entra ID.

This means the Week 4 task could not be completed because the account does not have the administrative rights required for this part of the Azure environment.

3. What I Would Have Done if Access Was Available

If the Microsoft Entra ID permissions were available, I would have done this instead.

3.1 Create Users in Microsoft Entra ID

First, I would have opened Microsoft Entra ID in the Azure portal and gone to the Users section. I would then have created at least two user accounts to simulate different roles in an organisation.

- netadmin1 – Net Admin 1
- supportuser1 – Support User 1

Creating separate users would have shown how individual identities are managed and tracked in Azure.

3.2 Create a Security Group

Next, I would have gone to the Groups section in Microsoft Entra ID and created a new security group called NET731-Admins. The purpose of this group would have been to organise users into one management unit so that permissions could be assigned more efficiently.

3.3 Add Members to the Group

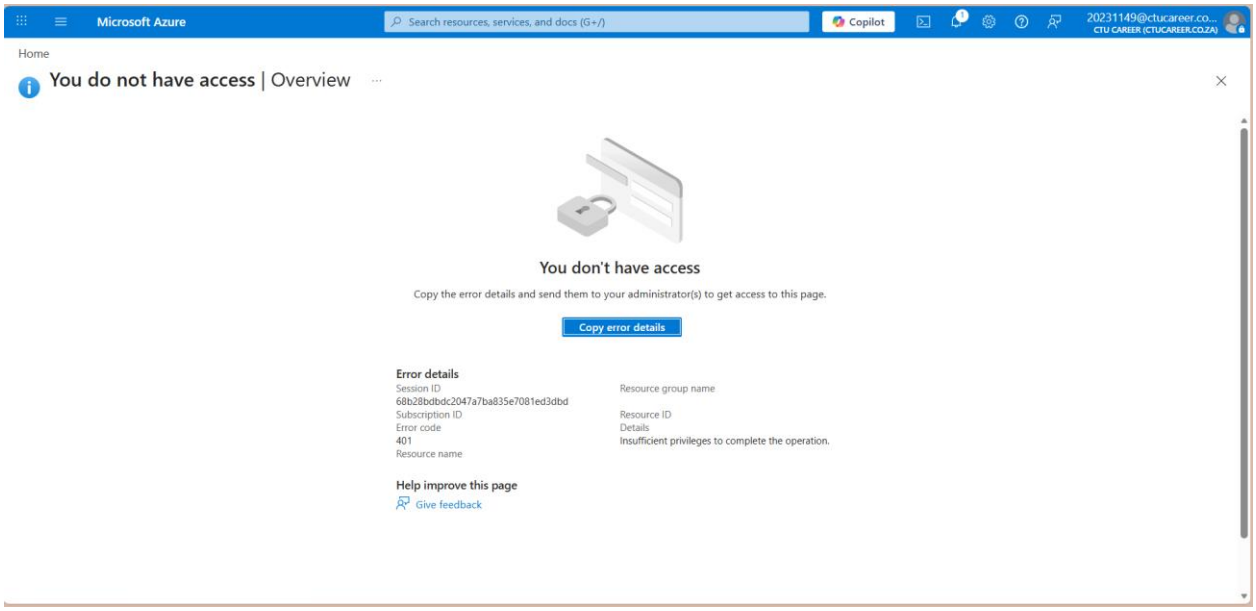
After creating the group, I would have added the two created users as members of the NET731-Admins group. This would have demonstrated how Microsoft Entra ID groups can be used to manage multiple users together instead of assigning permissions to each account individually.

3.4 Assign Initial Basic Role

Finally, I would have opened the resource group CTU-20231149-RG, gone to Access control (IAM), and assigned an initial basic Azure role. The selected role would have been Reader, because it provides basic viewing access without granting full administrative control. This would have demonstrated the principle of least privilege, which means users should only receive the minimum permissions needed to perform their tasks.

4. Evidence

The screenshot included shows the actual portal message received during the attempt to open the required identity management area. The message confirms that access was denied and that the operation could not continue because of insufficient privileges.



5. Conclusion

Week 4 could not be completed fully because the account used for the practical does not have sufficient privileges to manage Microsoft Entra ID. However, the expected process is clearly documented in this report to show what would have been done if the required permissions were available. The evidence included proves that the limitation was caused by access restrictions in the tenant.
