Task 1 – Set Up Azure for Students

Already completed the setup

Task 2 – Define Business Requirements

Business Requirements:

CTU Training solutions is a tertiary education environment that expands to different provinces in South Africa. They provide a learning environment for students, given that information it is fair to assume that they would need a quite big environment in size. The main I.T needs for this organization for staff would be components such as a Microsoft Azure account for administration of users, which in this case would be students. Lecturers would need to be given certain amount of access on applications such as Teams and Outlook for collaboration and communication. A cloud Solution such as Azure would be very important for students, the main reason being remote connectivity. This means that students are able to access their account in remote locations other than at school, using applications such as the Microsoft authenticator application to confirm their identity. A security solution that should be considered is the use of Multi-factor authentication for an optimal and secure authentication method. In terms compliance, I suggest the implementation of azure policies to ensure users in the environment do not gain unauthorized access and if they do, an administrator would be notified. The expected number of user will depend on the number of staff and students that each and every campus environment has but given that there are plenty of campuses across provinces, the estimated amount would be around 500 – 900 users.

Task 3 – Identify Required Azure Services

Azure Service	Purpose / Why you need it	Week it is used
Resource Group	For better management of resources	Week 1
Virtual Network (VNet)		
Virtual Machine (VM – B1s)		
Microsoft Entra ID		
Network Security Group (NSG)		
Azure Storage Account		
Microsoft Defender for Cloud		
Azure Monitor
