Week 04 – Identity Management (Project Orion)

Overview

This document outlines the setup of identity management in Microsoft Entra ID for Project Orion. It includes user creation, group configuration, and role-based access control (RBAC) design following the principle of least privilege.

Task 1: Planning

Naming Convention:

I used the format firstname.lastname@novatech.onmicrosoft.com. This ensures consistency and makes user management easier in a real organisation.

Group Design:

Security groups were used because they are designed for controlling access to Azure resources using RBAC.

Principle of Least Privilege:

This means users only get the minimum access needed to do their job, reducing security risks.

Task 2: Users and Groups

Users Created:

Alex Mokoena – Development – Developer

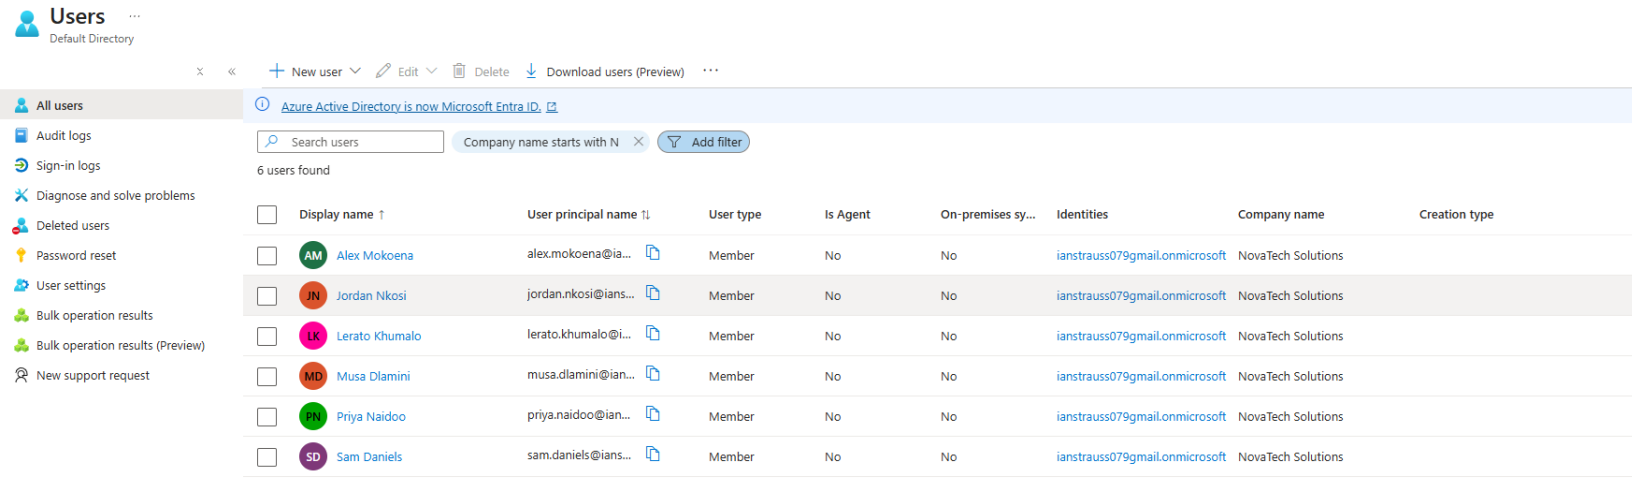
Jordan Nkosi – Development – Developer

Sam Daniels – Operations – Operations Analyst

Lerato Khumalo – Operations – Operations Analyst

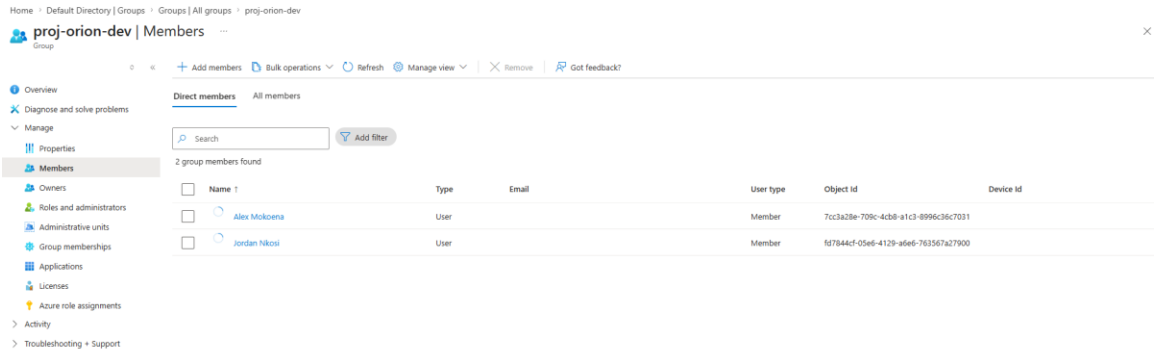
Priya Naidoo – Finance – Finance Officer

Musa Dlamini – Finance – Finance Officer

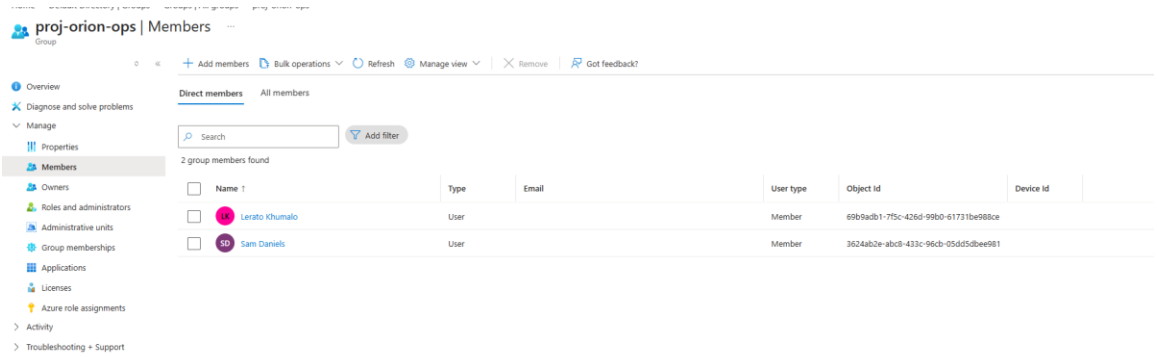


Groups Created:

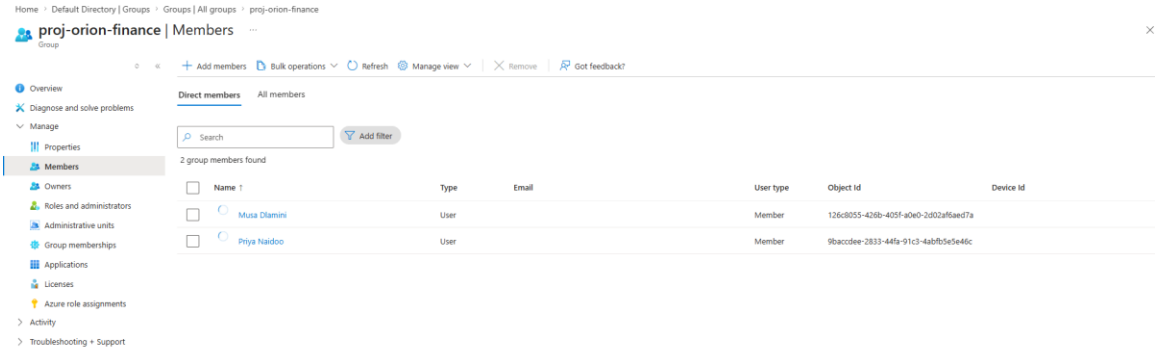
proj-orion-dev



proj-orion-ops



proj-orion-finance



Membership Type:

Assigned membership was used because it is simple and suitable for small environments.

Task 3: Role Assignment

Roles:

Development – Contributor
Operations – Reader
Finance – Reader

Scope:

Roles were intended to be assigned at Resource Group level to balance security and manageability.

Note: Role assignment could not be completed due to no active Azure subscription.
