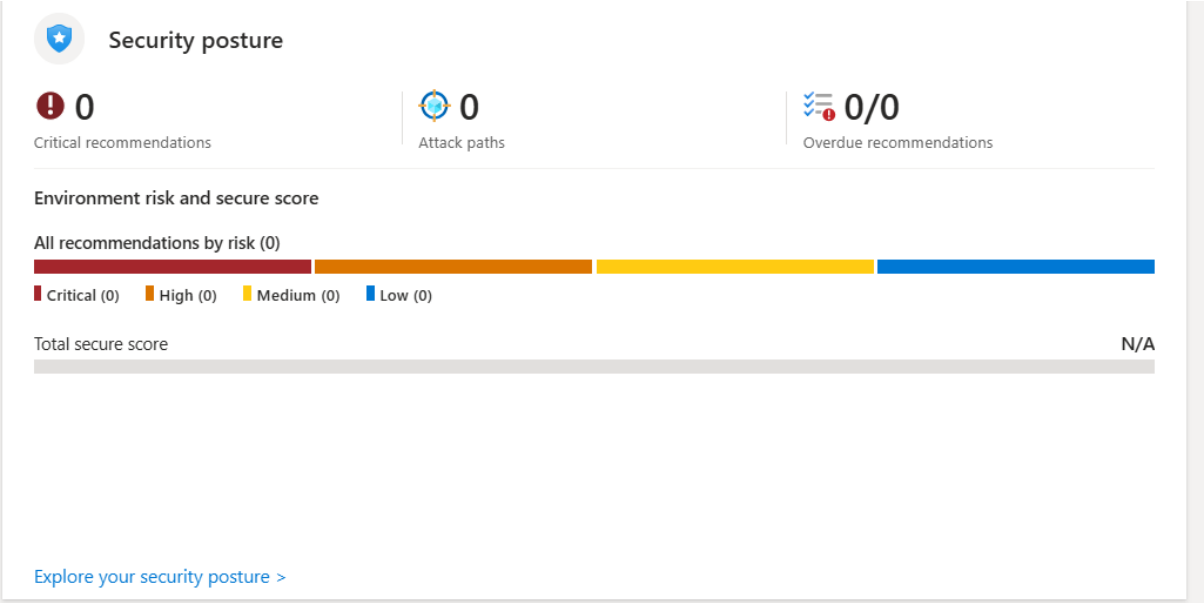
Task 1 — Security Posture Assessment



For reasons unknown to myself my environment doesn't display a secure sore, I will rather give a explanation on how recommendations are prioritized and provide the nature and risk of the most common recommendations:

How recommendations are prioritized:

Recommendations are prioritized on the potential risk it imposes, for example PIM would be useful, but it doesn't mean your environment is unsecure because of its absence it would get a medium recommendation. Something like a user's account being compromised would get a critical rating as it poses an immediate threat

Nature and risk of most common recommendations:

The most common way to add a ignorantly improve your security posture is by enabling security defaults which accomplishes the following :

Required MFA for all users

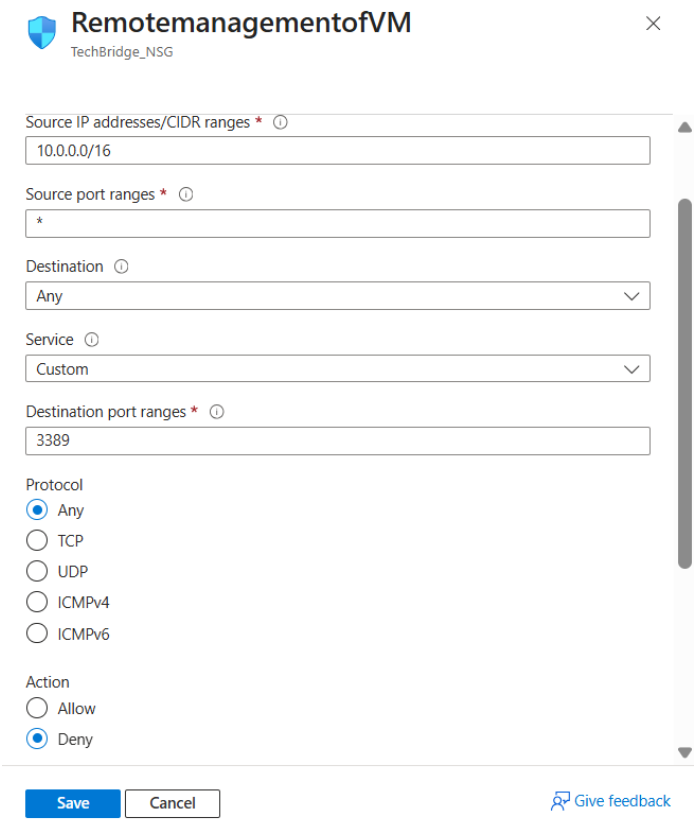
MFA for admin roles

Block legacy authentication

The risk of not having this is user and admin accounts being easy to compromise, all a malicious actor has to do is acquire the users password and they would have access to their accounts. MFA and blocking legacy authentication ensures a robust yet reliable layer of security

Remediation:

2a — Close Open Management Ports:



The menu showing the changes being made to remotemangmentofVM

Priority	Name	Port	Protocol	Source	Destination	Action
Inbound Security Rules						
100	RemotemanagementofVM	3389	Any	10.0.0.0/16	Any	Deny

The update NSG rule. The remote management port as been closed, this ensures no one can access the VM from the public facing internet making in more secure

2b — Enable OS Updates:

Home > Azure Update Manager | Machines > week6update | Updates > Updates

Create a maintenance configuration

Project details

Select a subscription to manage deployed resources and costs. Use resource groups like folders to organize and manage all your resources.

Subscription *	Azure subscription 1
Resource group *	week6updae_group Create new

Instance details

Configuration name *	week6
Region *	(Africa) South Africa North
Maintenance scope *	Guest (Azure VM, Arc-enabled VMs/servers)
Reboot setting *	Reboot if required
Schedule *	**Starts on:** Fri Apr 17 2026 00:00 (South Africa Standard Time) **Maintenance window:** 3 hours 55 minutes **Repeats:** Every day **Ends on:** - Edit schedule

Create a maintenance configuration

Included classifications

Operating system	Classifications included
Windows	Critical updates, Security updates
Linux	Security and critical updates

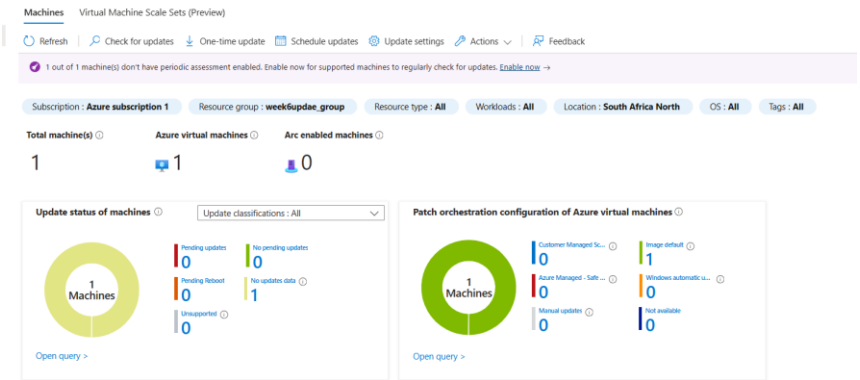
Included KB ID/packages

Operating system	KB ID/packages included
Windows	No KB IDs included.
Linux	No packages included.

Excluded KB ID/packages

Operating system	KB ID/packages excluded
Windows	No KB IDs excluded.
Linux	No packages excluded.

Settings for when the maintenance period is, this will also trigger the VM to update if there are any updates available for it



Proof of The OS scheduled updates being implemented
